2. On May 17 it was discovered that the false floor surrounding the machine did not allow proper clearance for the lamphouse and proper space to align the optics. It was necessary for the contractor involved with the flooring to remove portions of the floor and rework with the proper clearances. The standby time effected by this was:

May 17	18 hours
May 18	18 hours
May 19	18 hours
May 20	18 hours
May 24	8 hours
May 25	8 hours
14700 3 - 0	and the second s

Total time involved

88 hours

Total Per Diem days lost 8

STATINTL

It is felt that the problem of the flooring was one which was difficult for the flooring contractor to plan for, and that this problem is one that could reasonably be encountered in an interface between a sophisticated piece of equipment and a room installation. Thereasonably the problem in the total standby cost.

given instructions to the room contractor to "close the room."

There was only one man provided by the room contractor to complete this closing work, and had standby time during the following period:

June 9	16 hours
June 10	16 hours
June 11	16 hours
June 14	16 hours
June 15	8 hours
Jun-1-	

Total time involved 72 hours

Total Per Diem days lost 13

During this period two men to assist the contractor in closing the room, thus minimizing this lost time.

4. For several weeks preceding July 6 the contractor responsible for the room environment system was working on the system to bring it to within the specified requirements continued to work on as much of our installation as could be effectively accomplished during

U. S. Government 13 July 1971 Page 3 the period of environment adjustment. As was stated in my letter of July 2, would reach a point on July 6 where they could no longer effectively work because of the environmental conditions STATINTL existing in the room, and standby time occurred as follows: 40 hours July 6 40 hours July 7 40 hours July 8 40 hours 160 hours Time involved through the period of July 9 The Per Diem involved through July 11 is 30 days. As of July 9 the room was still not to the environment specification and it is anticipated that additional lost time will be occurring. will submit any further lost time as it occurs.

STATINTL

The detailed cost to date, reflected in the above paragraphs, is as follows:

Because of the extreme humidity and temperature the equipment has been subjected to during the period of environment adjustment, there is certain apparent damage has visually examined the equipment at this time and has prepared a proposal for corrections of these impairments. These estimates cover only what we can visually see since we cannot operate the equipment at this time. There is a great possibility and concern on that other damage caused by environment has occurred which will not be obvious until the equipment is in operation. Should this be the case the damage will be identified and a repair estimate will be given at that time.

	As a result of the high humidity rust and corrosion is appearing on some of the major components. There are two alternatives to correct this problem.
,	Alternate one is to leave the system intact and to clean off all of the obvious corrosion and rust as well as we can. This process will be helpful at the present, however it will not correct the potential of future corrosion. This cleanup work would include only the parts and assemblies to which we have ready access without disturbing the basic system. It is estimated it will take 100 man hours at a cost STATIN accomplish the work.
	The second alternative is to disassemble the effected subassemblies separately, refinish the parts, and reassemble, install, and realign the system. In this category one of the subassemblies visually effected is the interferometer. It is estimated that we can disassemble, recondition the mechanical parts, reassemble and align this unit in 500 hours at a cost
•	Rust and corrosion is also apparent in the optical system. At this time we cannot determine the extent or effect of this on the performance of the system. However, to properly correct the affected parts would require disassembling, correction of the components, and reassembly of the complete optical system. This would be an extensive undertaking, possibly involving the requirement for special tools, equipment and personnel of the manufacturer is not prepared to estimate the cost involved at this time. However if you decide that you wish to pursue this further, bould provide a cost estimate.
	Attached is a detailed break-down on the priced alternates discussed above.
	management and technical personnel are available to discuss or furnish any additional information you might require regarding the subjects covered.
